SEEDS

IN BULK

FOR MERCHANTS ONLY.

Offered by

Alfred J. Brown Seed Co.

Growers and Merchants,

Grand Rapids, Michigan.

March 1st, 1901.

TO THE TRADE.

WHILE an introduction seems unnecessary to those who have handled our seeds in the past, it might be proper to say a few words to those who are not already our customers. The seeds handled and sent out by us are very largely our own growth and those which are not are grown for us under contract by experienced seed growers in locations where soil and climate are best adapted to their culture.

Quality is always the first consideration with us and we spare no pains in striving to bring our seeds as near to the point of perfection as possible. We have made a demand for our seeds by offering the best regardless of the cost of production, and we shall continue to offer the best and at as low prices as such seeds can be afforded.

A GOOD REPUTATION.

A good reputation is very essential in any line of trade, but more especially is this true in the seed business where so much depends upon honesty and integrity. Dealers should always avoid handling seeds they have reason to doubt; more often they prove unsatisfactory and only result in a flat failure. Such seeds, if bought at half price, are not cheap. Sometimes a whole season is lost by sowing poor seed. We cannot too strongly impress this fact upon the seed buyer.

PRICES.

We aim to compete in prices with all reputable seed growers and dealers throughout the United States and Canada. With our improved facilities for the growing, harvesting and handling of seeds, we are frank in saying that we can and do offer as good or in many cases better value for the money than others. We will not, however, attempt to compete in prices with those who have no reputation to lose, nor will we employ such methods in our business that are necessary to accomplish us to do so.

TERMS.

Our terms on all vegetable and flower seeds are bills due June 1st, without regard as to date of purchase. A cash discount of one per cent. per month from date of shipment will be allowed. Clover, grass seeds, onion sets, seed grain, etc., are net cash upon receipt of goods.

We do not charge for boxes or barrels; grain bags only are charged for and these at actual value. All goods delivered to depot free of charge.

OUR GUARANTEE.

Seeds handled and sent out by us are given a careful germination test, and we believe them to be as fine a collection as can be found anywhere, but it is beyond our control to guarantee a crop. There are many contingencies constantly arising to prevent even the best seeds from producing a satisfactory harvest, and, while we exercise great care in the growing, harvesting and labeling of our seeds, we will not be held responsible for any failure as to vitality, purity, productiveness or any other matter pertaining to same. If the seeds are not accepted upon these terms and conditions, they must be returned at once, and any money paid for same will be promptly refunded.

SOUTHPORT RED GLOBE.

Our Southport Red Globe Onion is very popular among large onion growers in Michigan. The superior quality offered by us is the direct result of carefully selected bulbs from the true eastern grown Southport strain. The onions produced from our seed are of medium size, very solid. Color, dark red. They ripen early and never produce a stiff or watery neck.

"DWARF ESSEX" RAPE.

United States Department of Agriculture.

Circular No. 12, May 5, 1899.

Rape (*Brassica napus*, Linn.) is much like the Swedish turnip or rutabaga in appearance, but the root is more like that of cabbage. The leaves are large, glaucous, smooth, spreading, and variously notched and divided; the flowers are bright yellow, nearly one-half inch in diameter; the seeds are produced in pods usually two inches or more long.

Under ordinary field conditions the plant reaches a height of from 1½ to 4 feet, and the strong growing roots penetrate the soil to a considerable depth.

For its best development rape requires a rich, moist, loamy soil, and will usually do well on any but light sandy soils and stiff clays, such soils being usually deficient in vegetable matter. In general, a soil that will produce good crops of turnip, cabbage, wheat and corn will be suitable for rape.

Results obtained at the North Dakota Experiment Station indicate that the growing of a crop of rape on land that has been sown to wheat for a number of years produces a decided increase in the yield of wheat from the succeeding crop. This is a point of much value in regions where wheat is extensively grown.

Throughout the Northern States generally, seeding may take place from the first of June or possibly earlier, to the middle or last of July, according to the season and locality. In the South the seed may be sown in September or early in October. Under favorable conditions 2 to 3 pounds of seed per acre will be sufficient and it will never be necessary to use more than 5 pounds per acre. The seed should be planted in drills far enough apart to allow cultivation.

When rape is grown as a secondary or catch crop it will not often be possible to pay so much attention to the preparation of the soil and the time and method of seeding, and quantity of seed used may be varied to suit the circumstances. Often fine rape may be grown on land that has already produced a crop of some of the early maturing cereals, such as rye, oats, or barley. As soon as the crop of grain is removed the land is plowed or "disked" and at once seeded to rape. Field peas and other early maturing forage crops, or rye or winter oats that have been pastured off in spring may also be followed by rape with profitable results.

Another practice which is coming into favor in some sections of the country is to sow rape in the spring with some grain crop, such as wheat, allowing the former to take possession of the field when the latter has been removed. This method is especially satisfactory when succulent forage is desired for fall feeding. Rape may also be sown in the cornfield just before the last plowing, as is often done with rye and winter wheat.

The rape is usually ready for use in about 8 or 10 weeks from the date of seeding. The general practice is to use it as a soiling crop or as pasture. Sheep and swine may be turned into the field and allowed to remain until the rape is pastured off. Cattle may also be allowed to run in the field, but as they waste much of the forage by pulling up the plants and trampling them down it is a better plan to cut the rape with a scythe or mower and feed it to the animals.

With sheep and cattle care should be taken at first not to allow the animals to eat too much, as there is danger of injury from bloat. Hungry animals should not be allowed to eat their fill, and it is not best to turn them into the rape when the leaves are wet. There is no danger of bloating with swine. It is an excellent plan to have the fields so arranged that the sheep and cattle have access to an open pasture as well as to the rape. Animals should have free access to salt at all times when being pastured on this crop.

Rape has a high feeding value. It makes an excellent feed for fattening sheep and swine and for producing an abundant flow of milk in milch cows. On account of danger of tainting the milk many people do not feed it to cows until after milking. Rape can be used to good advantage as a part of the rations for animals that are being fed in pens for market or for the show ring. It is also a valuable food for young lambs at weaning time. By beginning as early as practicable in the spring and seeding at intervals of two or three weeks, a continuous succession of rape can be produced throughout the period when the permanent pastures are most likely to be short. Rape will endure quite severe cold weather and thus will last a long time after the ordinary pasture grasses succumb to the frost.
